ABSTRACT
Almost all the people are having a strong desire to conceive a child at some point during their reproductive lifetime. Understanding what defines normal fertility is crucial to help a person or couple to know when it is time to seek help. Factors like advanced maternal age, weight, diet, smoking, other medical conditions, ovulation disorders, hormonal disturbances, psychological factors, environmental pollutants, medications that hamper the ovulation, positive family history and infections might have an effect on conception in couples. Infertility can arise from either of the partners. But inadequate knowledge regarding fertility, misconceptions, myths have sometimes cause fatal incidences. In maximum cases of infertility the female partner is being always accused for the case. But practically both partners are equally responsible. That's why here an attempt has been made to describe the cause and responsible factors for fertility particularly in female cases from the lens of Ayurveda, discussing the Ayurvedic concepts and practices that are followed in case of infertility in females.

KEYWORDS: Infertility, Vandhya, Ayurveda, Diet, Ovulation.

INTRODUCTION
Infertility by itself does not threaten physical health but has a strong impact on the psychological and social well-being of the couples. Infertility can result in severe emotional stress. Couples often describe the “hope and despair” cycle, as they hope every month that they will finally conceive and then despair when once again it does not happen. Hence, infertility is of public health importance, especially in developing countries because of its high prevalence and its serious social implications.[1]

Ayurvedic texts vividly explain such conditions under Vandhya.[2] There are several pathological conditions leading to Vandhya. Artavanasha (Anovulation) is one among them. [3] All the four factors Rutu, Kshetra, Ambu and Beeja are prime requisites for the Garbha according to Acharya Sushruta. [4]

Since thousand years ago Ayurvedic drugs and treatment modalities have been found effective in treating infertility without the help of modern medical advancements as it enables the infertile women or couples to become fertile. In other words Ayurvedic drugs improve the overall health of the women to be able to conceive naturally without the aid of western medicine.[5] Ayurvedic medicine originated in India several thousand years ago. "Ayurveda" is a amalgamation of two Sanskrit words- "Ayus", meaning life and "Veda", meaning pure knowledge or science. Therefore, the term "Ayurveda" thus means 'the knowledge of life' or 'the science of life'.[6] As per Charaka Samhita, an integration and balance of mind, senses, body and the spirit is called "Ayus",[7] which is believed to prevent illness and promote wellness[8]. It defines a healthy person as one who is established in the Self (higher-self), who has, balanced Agni, balanced Doshas, properly formed Dhatus, proper elimination of Malas [wastes], well-functioning bodily processes, and whose mind, senses and soul all are full of bliss.

Ayurvedic interpretation of the female reproductive system
Ayurveda identifies the female reproductive systems Shroni means the pelvis. Female pelvis is 24 Angulas and is heavier than the pelvis of the male. There are three Srotas (also called capillaries) in women's body.

1. Rajovahasrotas: Includes uterus, cervix and vagina along with their blood supply.
2. Artavahasrotas: Includes ovary and fallopian tube along with their blood supply.
3. Stanyavahasrotas: Includes breast tissue along with its blood supply.[9]

Ashaya means any recipient viscus. Garbhashaya means uterine cavity, situated behind the Bhagasthi (symphysis pubis) and a little above the bladder.
which is surrounded by coils of intestines and is placed between small intestine (Pittashaya) and large intestine (Pakvashaya). Yoni consists of all the female genital organs.

Types of infertility as written in classical texts are: Vandhya- absolute sterility and incurable. Apraja women who become pregnant and curable. Sapraja women who become infertile with infertility during her reproductive life after already conceiving once or more. Menstrual cycle (an indication of the state of the health of the female) can be affected by many factors like diet, emotional instability, excessive physical exercise, life-style, and stress.[8] These are responsible for creating an imbalance of the Doshas that control the activities of the body-Vata, Pitta and Kapha.

- Without Vata, Yoni never gets spoiled[9], here the word "Yoni" refers to reproductive organs collectively. Vata Dosha is the governing factor of the whole reproductive physiology; ovulation is also under the control of Vata. Therefore any vitiation of Vata will certainly affect the ovulation. An excessive bout of exercise, fear, anxiety or stress, trauma, excessive fasting as is the case in eating disorders or diet including cold, light and dry substances can cause imbalance of Vata.[10] However, infertility rarely involves only one Dosha.

- People with Pitta nature may experience infertility resulting in scarring of the fallopian tube, inhibiting the ascent of the sperm or descent of the ovum. Excess heat may also be responsible for depletion of Shukra Dhatu.[11]

- On the other hand, Kapha people because of the dominant water element in their constitution that supports Shukra Dhatu experience the healthiest and the strongest reproductive system. Infertility in those with Kapha is initiated by a cold, heavy and oily diet along with a sedentary lifestyle. When Kapha Dosha is predominant, fallopian tubes may thicken, uterine fibroids may develop, and often involves Pitta and Vata displacement. Scar tissue is due to Pitta pushing Kapha.

- Dietary management: Diet plays a vital role in the maintenance of good health and in the prevention and cure of diseases. In ancient Indian scriptures, food has been compared with the God, (Annam Brahman) since it is the main factor, which sustains and nourishes life.[12] In Shrimad Bhagavad Geeta, Lord Krishna has compared himself with the digestive fire, which assimilates and digests all the four types of food in order to maintain the life.[13] As per Ayurveda, food affects the mind also by causing either an increase or decrease in the three qualities of mind, i.e., Satvaguna, Rajoguna and Tamo guna[14]. It is said in ancient Indian literature that if dietetics is followed, medicine is not needed and if dietetics is not observed, even medicines are not useful.[15] Dietary management involves strict compliance and adherence to Ojas-building foods and to avoid the substances which diminish the Ojas. This is critical as it regulates ovulation and enhances fertilization.[16] Eating whole foods not only provides fiber that influences hormonal levels but also provides all nutrients for the health of the body. Processed carbohydrates, antibiotic and hormone laden meat and milk, excess starch, and canned products destroy fertility.[14] Food such as ghee, milk, nuts, dates, sesame seeds, pumpkin seeds, saffron, honey, and avocados help to replenish and build Ojas[17]. Fresh, organic fruits and vegetables, whole grains, protein from plant sources like beans, and peas, sweet, juicy fruits such as mangoes, peaches, plums, and pears, asparagus, broccoli, spices such as Ajwain powder, cumin (purifies the uterus in women and the genitourinary tract in men), turmeric (to improve the interaction between hormones and targeted tissues), and black cumin boost fertility. Root vegetables, grains, arugula, watercress, onions, garlic, chives improve circulation and nourish the blood.[18]

- Ayurvedic herbs: As infertility is not a disease by itself but a manifestation of some disease, the herbs used in the treatment are directed towards eradicating the underlying cause.[19] The most commonly known and used herbs such as Ashwagandha (Withania Somnifera), Shatavari (Asparagus Racemousus), Amlaki (Emblica Officialis) and herbal formulas such as Mensu and Chyavanprash are extremely useful formulations which help to create the synergistic hormonal balance between the Follicle Stimulating Hormone (FSH) and the Luteinizing Hormone (LH).[20]

- No individual herb alone is considered useful for promoting fertility. Therefore, a combination of herbs is used in the treatment of infertility with the purpose of correcting a organic or functional problem that causes infertility. [21]

- Medicated Ghees and oils such as Satapushpa tailam, Narayanatalaiam, Phalasarpis, Kalyana ghrita, Kalyanagulam, Dadmadighrita are commonly used.[22] The right combination of herbs helps in regulating menstrual cycles, enhancing general health and wellness, invigorating sperm (enhancing a man’s sperm count, morphology and motility), reducing stress, enhancing sleep controlling anxiety and increasing energy level, balancing the endocrine system, increasing the chance of pregnancy for women undergoing in-
vitro fertilization (IVF) and improving blood flow in pelvic cavity, thereby promoting fertility.[23]

- **Panchakarma therapies:** Therapies such as Shirodhara, Abhyanga, Marma therapy, Nasya, Basti, chakra balancing Pinda, Visesh and vedana help in releasing tension, impurities and trapped energy within the body. They nourish the body, revitalize the mind and strengthen the immune system. Rejuvenation therapies are beneficial in reducing stress, nourishing all Dhatus of the body and pacifying Vata.[24] Panchakarma is usually prescribed for infertile couples. Rejuvenative therapies are basically recommended for VataDosha, and cooling light therapies for Pitta Dosha. Shodhanachikitsa helps in uterine hostility, and non-ovulatory cycles.

- **Removal of local disorders:** To remove obstructions in passage and to facilitate proper coitus, and to increase receptivity of the genital tract to the entry of the sperm, Basti is recommended. Massaging the body reduces stress, rejuvenates the entire body, and pacifies the underlying Dosha. Female infertility is sometimes caused by blocked tubes, pelvic adhesions or other types of trauma or inflammation in the reproductive organs.[25] While a long believed that surgery procedures were the only way to even partially decrease these problems, Ayurvedic experts have founded a deep tissue work can not only decrease mechanical blockages, but also reduce pelvic pain and improve sexual arousal and orgasm for women.[26]

- A sedentary lifestyle results in stagnant lymph flow. If the body is too active, the body may not be able to carry away all the waste that is produced. Therefore, the deep tissue massage works to stimulate the flow of lymph. This bodily fluid carries wastes and impurities away from tissues and needs muscle contractions to move efficiently throughout the body. The massage can help in increasing the chances of conception by clearing blocked fallopian tubes.[27] Reflexology, is an effective technique of interrupting stress and returning the body to a state of equilibrium which involves massaging different areas of the hands and feet (to establish the tension level for the rest of the body) corresponding to those internal organs that may cause infertility. [28]

- Acupuncture is yet another option that can be done on its own or along with other assisted reproductive technology (ART) procedures. Studies have proved the effectiveness of acupuncture for infertility.[27]

**CONCLUSION**

Infertility has increased tremendously in the past decade and this is due to the result of a combination of social, environmental, psychological, and nutritional factors. Today, the modern medicine has the ability to find out the causes of infertility in an individual through several diagnostic tests and examinations. Using these tests, the treatment focuses on correcting and treating the dysfunction. Infertility is managed by looking at the reproductive system components. Ayurveda pays attention to each individual body types, enhances the body systems participating in the process of fertilization and therefore serves as an excellent alternative for reaching fertilization. Ayurveda addresses the internal balances and external influences contributing to the problem by building the Ojas, improving the overall health of the individual, stimulating the hypothalamus and pituitary glands thereby indirectly inducing the ovaries to ripen and release eggs. Ayurveda provides a noninvasive, low cost and non-iatrogenic alternative and complement to modern western medicine in the treatment of female infertility. Because Ayurveda focuses on rebalancing individuals rather than just treating diseases, its treatments are have low potential for side effects. Additionally, they tend to promote the systemic health and well-being of the individual. Firstly, it makes an attempt to correct infertility through Ayurvedic treatment and then, if that fails, to subsequently employ the more forceful but also more risky treatments of modern Western medicine. It is also possible to use the high-tech diagnostic tests of modern medical science and its patho physiological specificity with the holistic approach. Ayurveda guides us to connect to our inner wisdom and grace and heal from within. Although a number of treatments are available to treat infertility, their large costs force most of cases to consider alternative approaches such as, homeopathy, assisted reproductive technologies, Ayurveda, aromatherapy etc.
